FISH CHECKLIST

There are hundreds of different types of fish which can be kept as pets with some more challenging to keep than others. They are often divided into two broad groups: cold water and tropical fish. Always check with a specialist pet shop which fish suit you best. This checklist is purely a guide and some elements may not be applicable to fish you are thinking about getting. Many conditions in fish occur due to inappropriate water conditions so checking the water quality regularly is important.

- Appropriate sized tank, with lid if recommended
- Thermometer to ensure the correct water temperature
- Water filter
- Air pump if applicable
- PH water testing kit
- Water heater if applicable
- Gravel/flooring
- Fish food

*Top
Tip*

Ensure your fish tank is not in direct sunlight or near a radiator. Be mindful of using sprays/aerosols around your fish tank, especially if there is not a lid, as many can be toxic to fish.
